

### PART 3

One can easily observe that most of the users logged in through android only, so to attract more ios users as it already has a strong hold, we can give some extra rewards. It might attract them so that they can log in in more short intervals or add some rewards available for a specific time. This might help to increase the login activity of users.

These graphs help us understand the status of their rewards, whether they cashed it or it has been rejected or submitted. So you can observe that most of the receipts are in finished status, and the ones whose status has been submitted have null values, or we can assume that they had exchanged their points for the respective reward. The limit has been reset, and similarly, for the rejected ones, they might be expired, and at last, for finished, it might mean they are in an active state but have not been submitted yet. The users might wait for their saucers to reach a certain point to buy something specific.
